Intro

Install Ubuntu on Virtualbox

Incase you are using Windows or MAC platform, this guide show you how to install Ubuntu inside virtual machine.

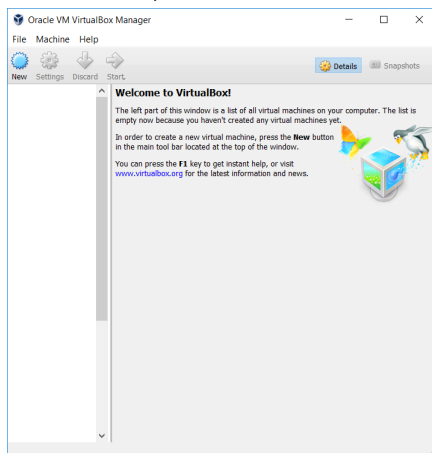

Install Virtualbox

Go to link <https://www.virtualbox.org/wiki/Downloads> and download the last version of virtual box. Then install virtual box in your local machine.

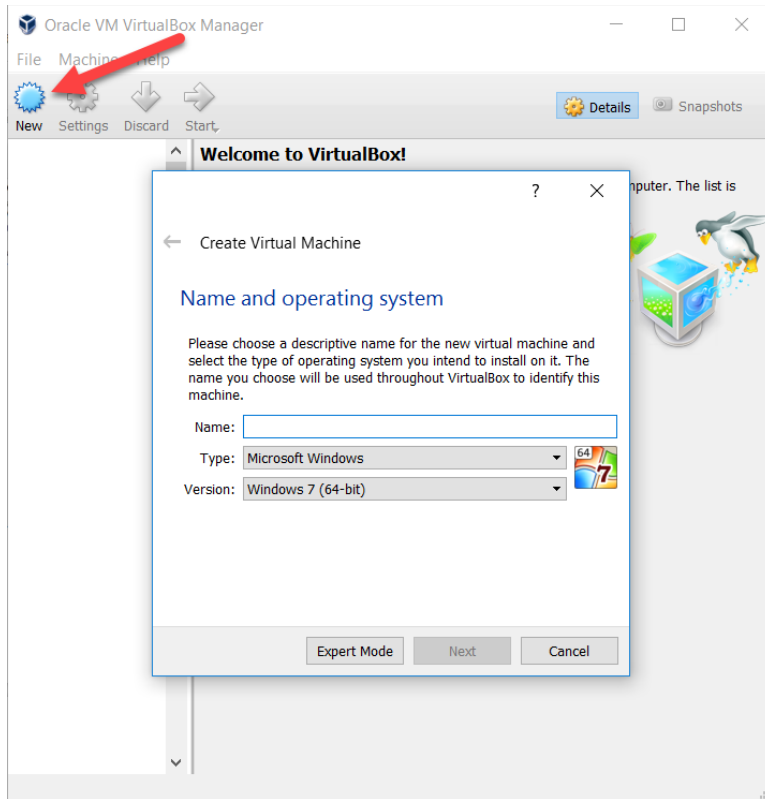

Create a new virtual machine

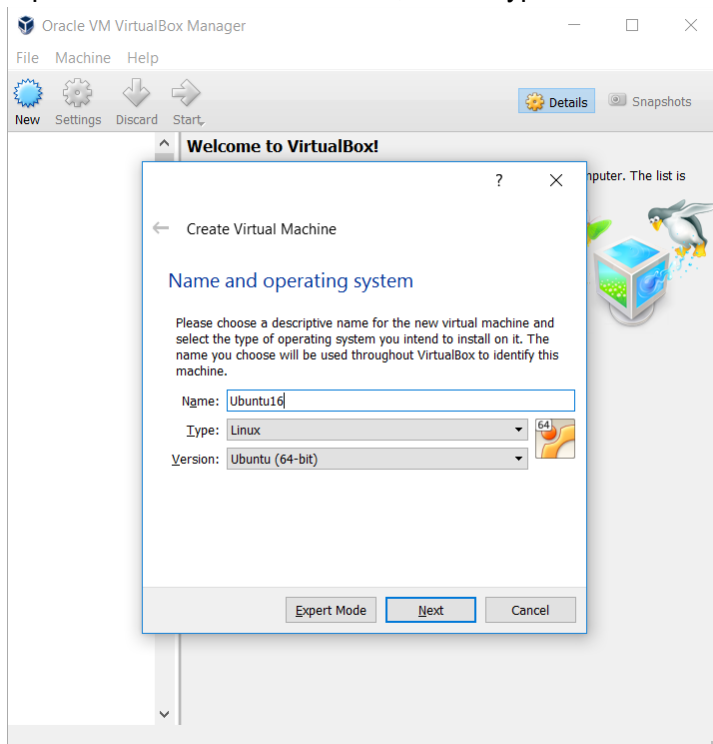

After install, start virtual box

Then click to "New" button

Input "Ubuntu16" to name box, select type and version as below. Then click "Next" button.

Select the ram memory you want for system, then click Next

The screenshot shows the 'Create Virtual Machine' dialog box with the 'Memory size' tab selected. The dialog has a title bar with a question mark and a close button. A back arrow and the text 'Create Virtual Machine' are at the top left. The title 'Memory size' is in blue. The instructions state: 'Select the amount of memory (RAM) in megabytes to be allocated to the virtual machine.' and 'The recommended memory size is **1024 MB**.' Below this is a slider bar ranging from 4 MB to 16384 MB. A blue marker is positioned at 2048 MB, which is also displayed in a text box next to the slider. At the bottom are 'Next' and 'Cancel' buttons.

← Create Virtual Machine

Memory size

Select the amount of memory (RAM) in megabytes to be allocated to the virtual machine.

The recommended memory size is **1024 MB**.

4 MB 16384 MB

2048 MB

Next Cancel

Keep the choice for virtual disk as default then click to “Create”

The screenshot shows the 'Create Virtual Machine' dialog box with the 'Hard disk' tab selected. The dialog has a title bar with a question mark and a close button. A back arrow and the text 'Create Virtual Machine' are at the top left. The title 'Hard disk' is in blue. The instructions state: 'If you wish you can add a virtual hard disk to the new machine. You can either create a new hard disk file or select one from the list or from another location using the folder icon.' and 'If you need a more complex storage set-up you can skip this step and make the changes to the machine settings once the machine is created.' Below this, it says 'The recommended size of the hard disk is **10.00 GB**.' There are three radio button options: 'Do not add a virtual hard disk', 'Create a virtual hard disk now' (which is selected), and 'Use an existing virtual hard disk file'. Below the radio buttons is a dropdown menu showing 'Empty' and a folder icon. At the bottom are 'Create' and 'Cancel' buttons.

← Create Virtual Machine

Hard disk

If you wish you can add a virtual hard disk to the new machine. You can either create a new hard disk file or select one from the list or from another location using the folder icon.

If you need a more complex storage set-up you can skip this step and make the changes to the machine settings once the machine is created.

The recommended size of the hard disk is **10.00 GB**.

☐ Do not add a virtual hard disk

☒ Create a virtual hard disk now

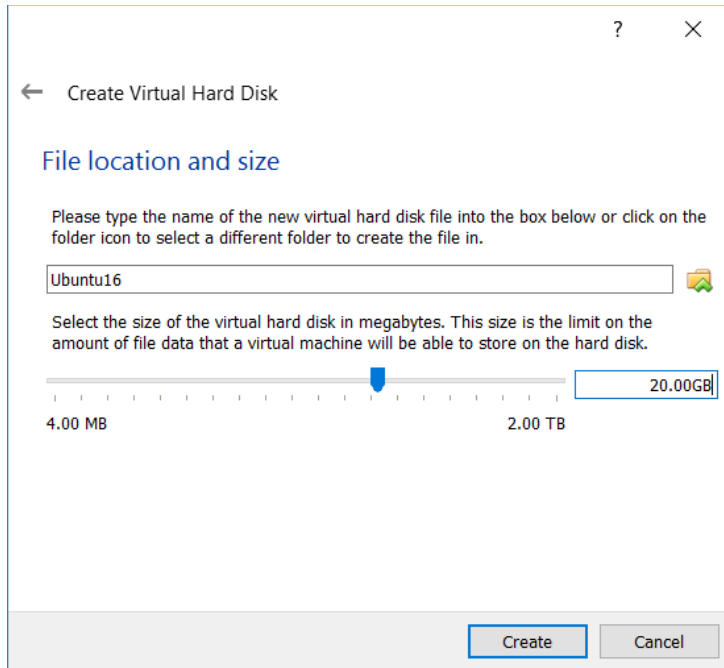

☐ Use an existing virtual hard disk file

Empty

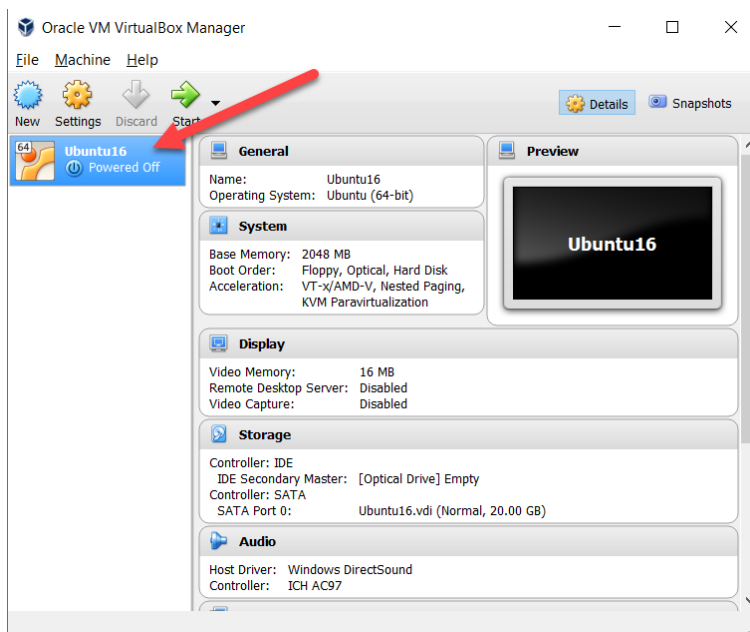

Create Cancel

Then keep all selection as default.

Select the hard disk volume for your system, then select “Create”

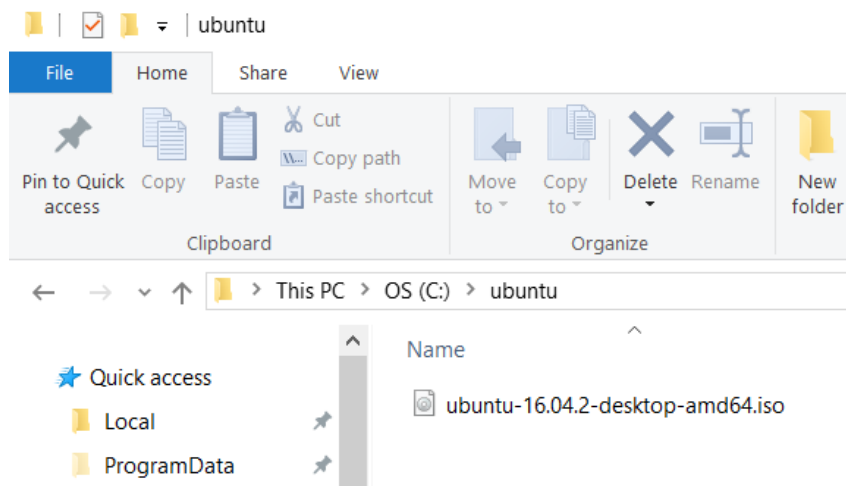

A new virtual machine is added to virtualbox

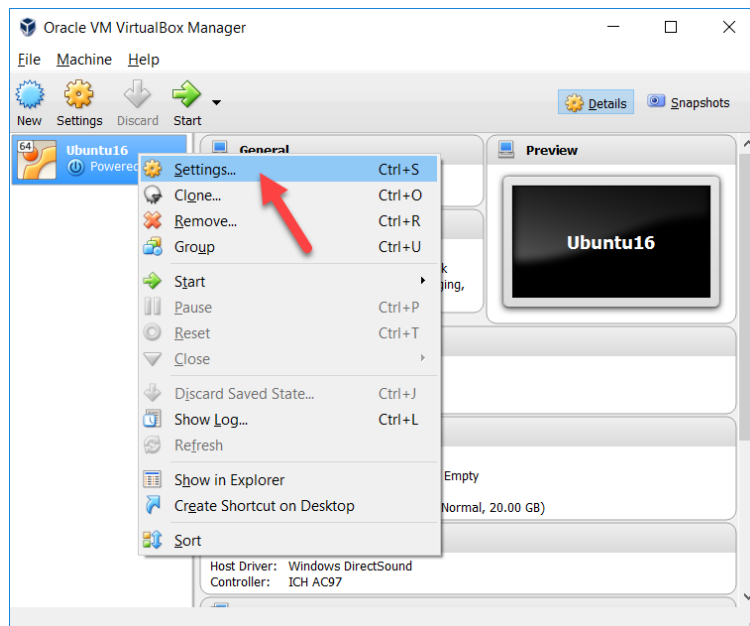

Install Ubuntu in Virtual Machine

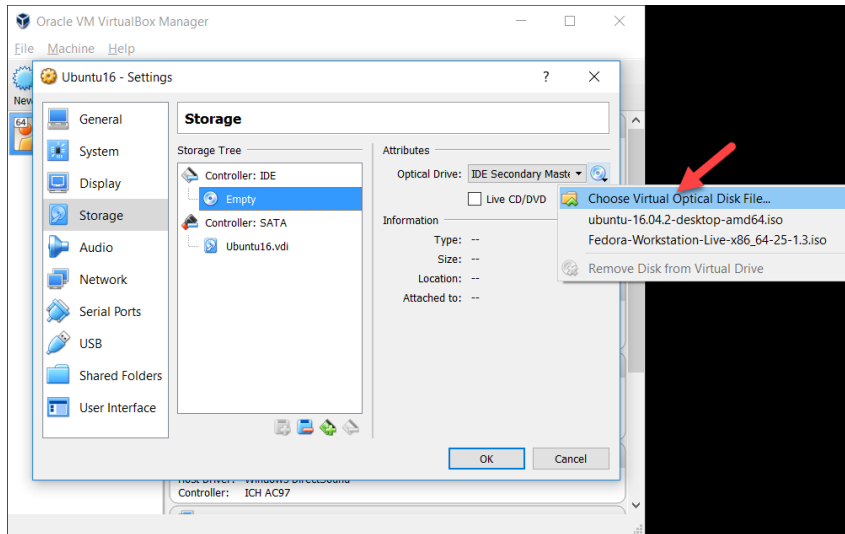

Go to link <https://www.ubuntu.com/download/desktop> to download desktop version
Then save iso file to a folder

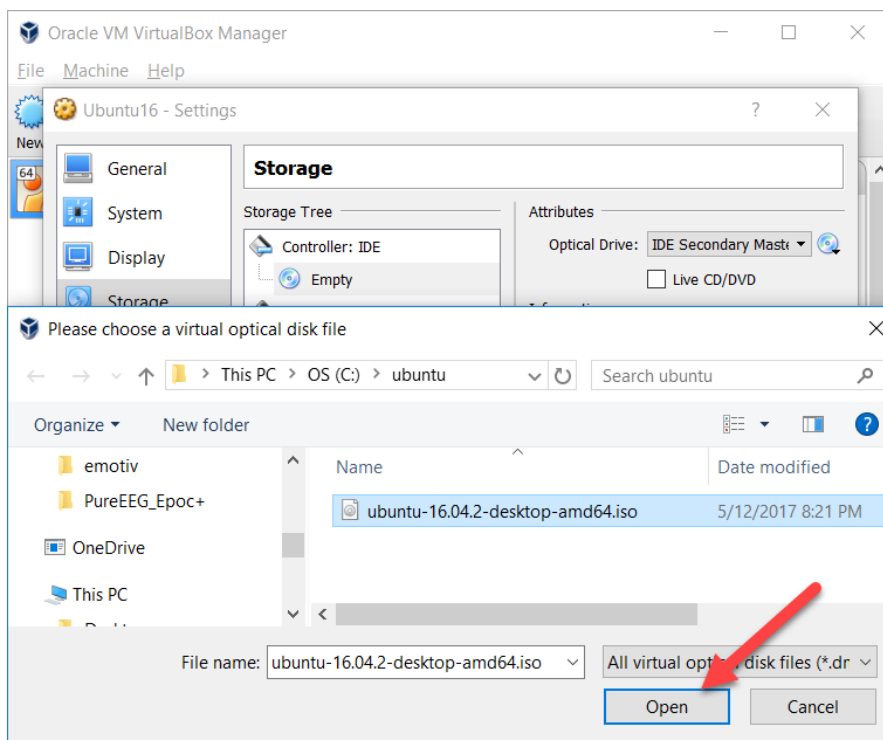

Select “Ubuntu16” virtual machine which already created before, right click and select “Settings...” menu.

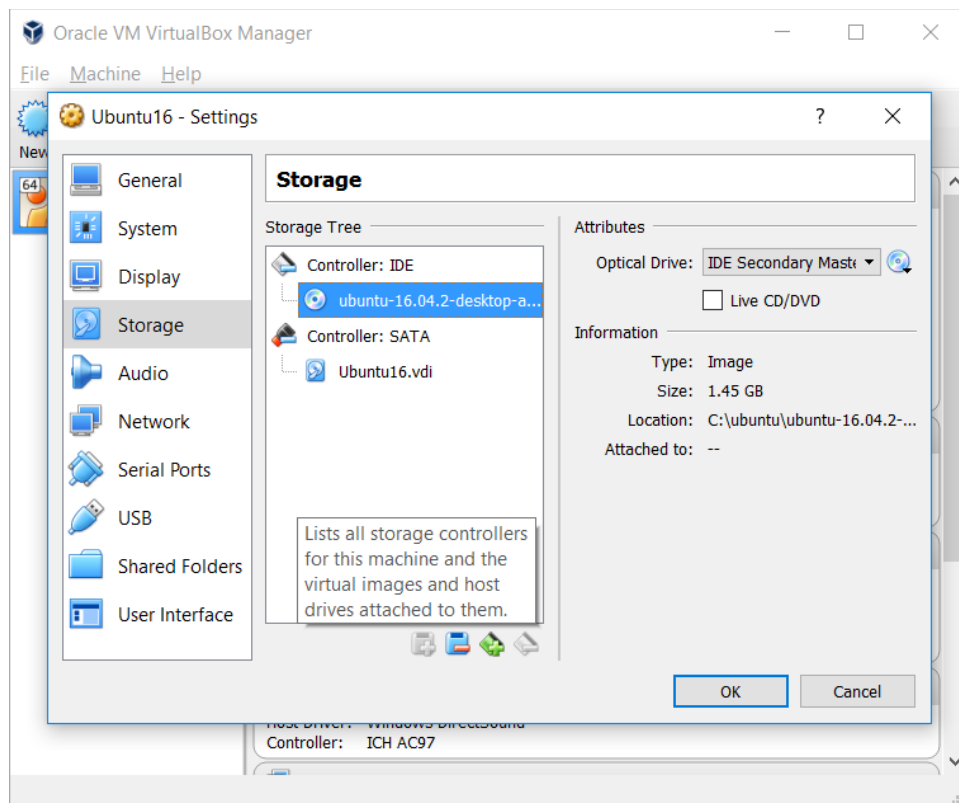

Select “Storage” , then select “Empty” disk, then click to cd icon, then select “Choose Virtual Optical Disk File...”

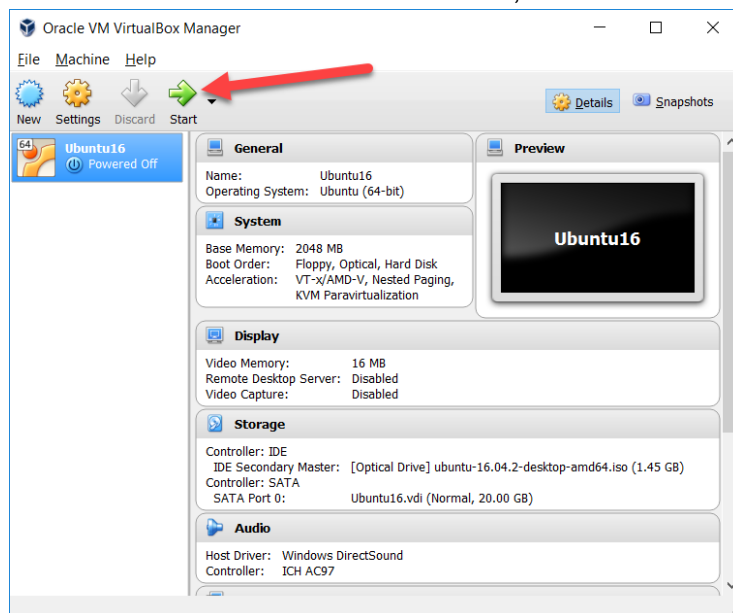

Navigate to folder which contain Ubuntu iso file and select that file, then click “Open”

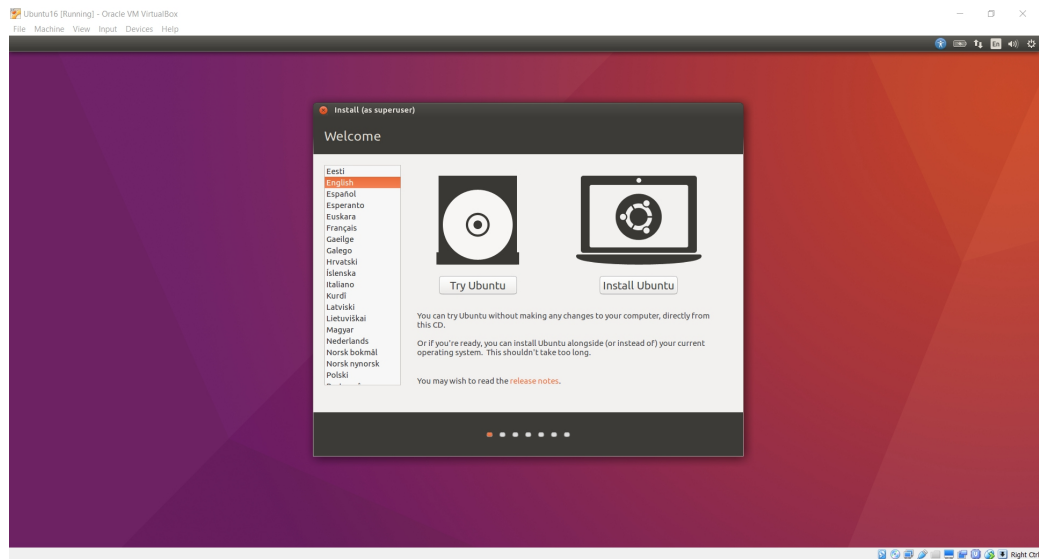

Click to “OK” button

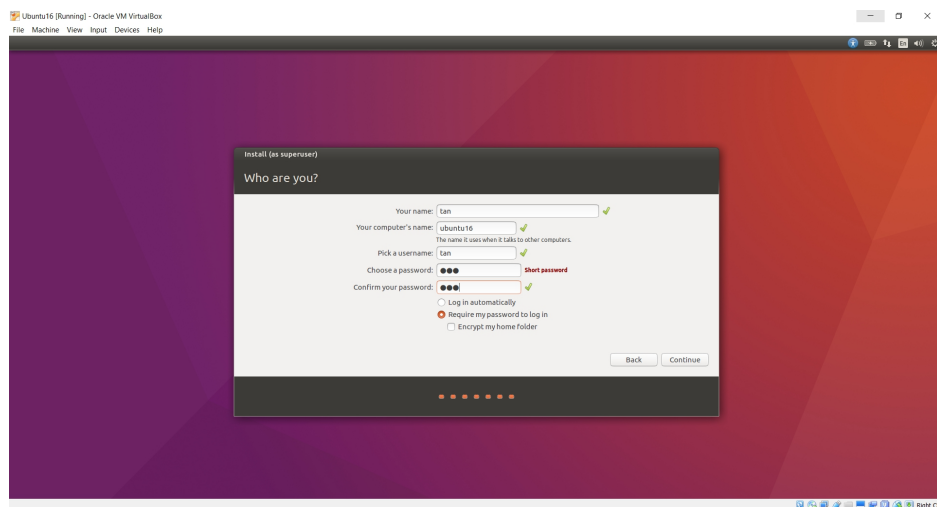

Now select “Ubuntu16” virtual machine, then click to “Start” button

Virtual machine will boot up and start process of install Ubuntu. Select “Install Ubuntu”

Keep the default option and continue of installation, until the screen of install super user. Input your name and password. Then click “Continue”

Wait some time until instalation complete. Then restart the virtual machine by click to “Restart Now”

That it. You already complete install Ubuntu inside virtual box.

Terminal intro

To open the terminal, click to home button and typing in "Terminal", then select Terminal

| Command | Meaning |
|---------|---------------------------|
| date | show up current date time |
| cal | show up calendar |
| man | show up command document |
| clear | clearn up the terminal |
| history | show up command history |

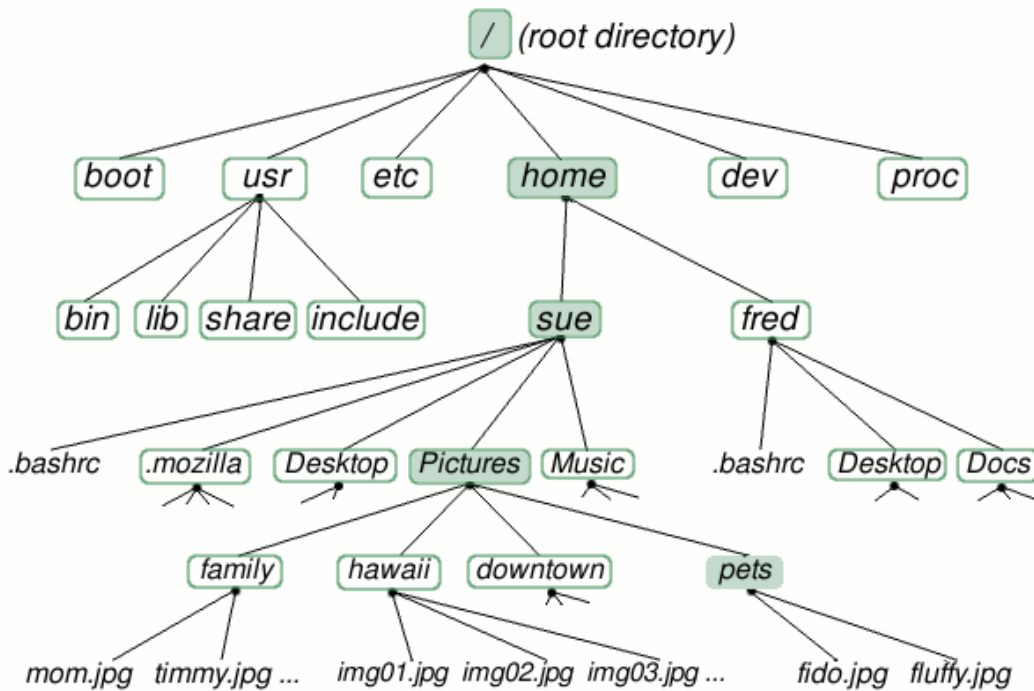

Navigation & Exploration

File system structure

Following image demonstrate file system structure like a tree. File structure start with root directory (/) then branch to difference folder for difference purpose.

- boot : contain file need for boot up process
- home : contain user data

- etc : contain configuration files
- In each folder contain 2 hidden folders (. link to current directory and .. link to it's parent)

Print current directory with “pwd”

In order to know currently where you are, pwd is a useful command, it print out full part of current directory.

```

tan@ubuntu16: ~
tan@ubuntu16:~$ pwd
/home/tan
tan@ubuntu16:~$
  
```

Changing current working directory with “cd”

| Command | Explain |
|-------------------|---|
| pwd | Print current working directory |
| cd / | Go to root directory |
| cd ~ or cd | Got to home directory |
| cd .. | Go to parent directory or go up one level |

Notes:

- When you are on bash, you are always some where inside file system, and it call “current working directory”
- Absolute path

An absolute path is defined as the specifying the location of a file or directory from the root directory(/). In other words we can say absolute path is a complete path from start of actual filesystem from / directory.

- Relative path

Relative path is defined as path related to the present working directory(pwd). Suppose I am located in /var/log and I want to change directory to /var/log/kernel. I can use relative path concept to change directory to kernel with command : cd kernel

List directory content with “ls”

| Command | Meaning |
|--------------|--|
| ls -a | Show all including hidden file and folder (a mean all) |
| ls -l | Show items with long list format (l mean long). Sorted items by name |
| ls -t | Show items with sorted by last modified (t mean time) |
| ls -S | Show items with sort by size (S mean size) |
| ls -R | List file recursively |
| ls -r | Show items in reverted order (r mean revert) |
| ls -h | Show items with readable by human (h mean human) |

Note:

- Every folder contain 2 hidden folders (. current directory) and (.. parent)
- File start with “-”, folder start with “d”

Auto completion

- Using “tab” to auto complete file or folder name
- Using “tab” key twice will open up suggestion
- Using “up key” or “down key” to call command which already run in history

Practice

- Let's start by getting familiar with moving around. Use the commands `cd` and `ls` to explore what directories are on your system and what's in them. Make sure you use a variety of relative and absolute paths. Some interesting places to look at are:

- `/etc` - Stores config files for the system.
- `/var/log` - Stores log files for various system programs.
- `/bin` - The location of several commonly used programs
- `/usr/bin` - Another location for programs on the system.

- Now go to your home directory using different methods.

File Administration

Create directories with “mkdir”

| Command | Meaning |
|---|---|
| mkdir newdir | Create a new directory with name newdir |
| mkdir newdir1 newdir2 newdir3 | Create multiple directory at once |
| mkdir newdir{1..5} | Create 5 directory at a time |
| mkdir -p newdir4/newdir5/newdir6 | Auto create parent directory newdir1 and newdir2 if it is not yet exist (p mean parent) |

Copy files and directories with “cp”

| Command | Meaning |
|---|---|
| cp image.jpg newimage.jpg | Copy a file and give a new name for it |
| cp image.jpg folder/ | Copy a file to a folder |
| cp image.jpg folder/newimage.jpg | Copy a file to a folder with new name |
| cp *.txt folder/ | Copy all txt file to a folder |
| cp -R folder newfolder | Copy whole folder to a new folder |
| cp -u | Copy at update mode, only do copy action if source file is newer or destination file do not exist |
| cp -v | Show up in the terminal what happen |

Move and rename files and directories with “mv”

| Command | Meaning |
|---------------------------|------------------------------|
| mv file1 file2 | Rename file1 become file2 |
| mv file folder | Move file to a folder |
| mv folder1 folder2 | Move folder 1 in to folder 2 |

Remove files and directories with “rm”

| Command | Meaning |
|---------------------|---------------------------------------|
| rm file | Remove file |
| rm *.txt | Remove all file with extention is txt |
| rm -r folder | Remove folder |

Find with “find”

| Command | Meaning |
|--|---|
| find directory -name file_name | Search file by name inside directory |
| find directory -name file_name -delete | Search file by name inside directory and then delete if found |
| find directory -name directory_name -type d | Search directory by name inside directory |
| find directory -mtime +1 | Search all file inside directory which is modified > 1 day. |

Find with “locate

| Command | Meaning |
|-----------------------------|---|
| locate test.txt | Locate path which contain “test.txt” in entire file system. |
| locate -c test.txt | Show up counting of result, not the absolute path. |
| locate -l 1 test.txt | Limit the output, only show one result |
| sudo updatedb | Update db to include all current change in file system. |

Wildcards

Wild cards is a fast and powerful way to select multiple file at once. Here is the basic set of wildcards:

- * - represents zero or more characters
- ? - represents a single character
- [] - represents a range of characters

Follow are some common wildcard pattern used.

| Command | Meaning |
|---------|--|
| * | All files |
| g* | All file beginning with g |
| b*.txt | Any file beginning with "b" and ending with ".txt" |

Practice

1. Create a directory testdir in your home directory.
2. Change to the /etc directory, stay here and create a directory newdir in your home directory.
3. Create in one command the directories ~/dir1/dir2/dir3 (dir3 is a subdirectory from dir2, and dir2 is a subdirectory from dir1).
4. Remove the directory testdir.

File Content

View file content with "cat, head, tail"

| Command | Meaning |
|--------------------------------|-------------------------------|
| cat filename | View full content of one file |
| cat filename1 filename2 | View full content of two file |
| head filename | Show first 10 lines of file |
| head -n 5 filename | Show first 5 lines of file |
| tail filename | Show last 10 lines of file |
| tail -n 5 filename | Show last 5 lines of file |

View file content with "less"

Using less command allow us to navigate and search inside document.

| Command | Meaning |
|---------------|--|
| Down key | Go down 1 line a time |
| Up key | Go up 1 line a time |
| Space | Go down 1 page a time |
| b | Go up page by page |
| g | Go to top of file |
| G (Capital G) | Go to end of file |
| /text | Search for text inside document and from top to bottom |
| ?text | Search for text inside document and from bottom to top |
| q | Quit the less command |

Create empty file with “touch”

| Command | Meaning |
|-------------------------|---|
| touch file1 file2 file3 | Create 3 empty files if these files not yet exist. If file1, file2, file3 already exist, touch command will update the file timestamp. |
| touch name_{1..1000} | Create 1000 files at a time. |

Edit file with “nano”

| Command | Meaning |
|----------------------|------------------------------|
| nano filename | Create and start edit a file |
| Ctrl + x | Exit nano |
| Ctrl + o | Save file |
| Ctrl + w | Search for text |
| Ctrl + k | Cut currently line |
| Ctrl + u | Paste a line |

Search file content with “grep”

| Command | Meaning |
|---------|---------|
|---------|---------|

| | |
|--------------------------------|--|
| grep "this" demo_file | Search "this" string in demo_file |
| grep "this" demo* | Search "this" in all file which start with "demo" |
| grep -i "the" demo_file | Ignore case sensitive, match both "the" and "The" |
| grep -w "is" demo_file | Search for full word only |
| grep "lines" | Match regular expression, return all line which contain string "lines" |

Demo file content

```
THIS LINE IS THE 1ST UPPER CASE LINE IN THIS FILE.
this line is the 1st lower case line in this file.
This Line Has All Its First Character Of The Word With Upper Case.
```

```
Two lines above this line is empty.
And this is the last line.
```

Process

| Command | Meaning |
|--------------------------------|--|
| top | View the process in real time. What kind of process consume most of resource (CPU, RAM) |
| ps -ef grep "firefox" | View all process running, combine with grep to search for process pid. This example search for firefox pid |
| kill pid | Kill process based on pid |

Network

| Command | Meaning |
|--------------------------|---|
| ifconfig | Check network information, get ip address |
| ping google.com | Check if google a live |
| wget link_to_file | Download a file from internet |
